# GF Piping Systems quality is no coincidence!

GF Piping Systems has not only taken a pioneering role in the past for the range of PVC fittings and equipment, but also in the sector of fusible plastics.

GF Piping Systems developed the socket fusion jointing process 30 years ago and

later also the electrofusion system for domestic installations and distribution. The development and introduction of infrared fusion technology is more evidence of GF Piping Systems focus on developing new technologies for the customer's benefit.

## Selection and calculation basis

The use of PN to specify the pipe dimension, a practice commonly applied throughout the world, poses considerable danger of confusion for butt fusion.

We therefore recommend that dimension and wall thickness, in addition to ISO series or SDR, are always indicated.

|                                | Formula        | Example                     |
|--------------------------------|----------------|-----------------------------|
| SDR – Standard Dimension Ratio | $SDR = d/e$    | $SDR = 110/10 = 11$         |
| Pipe series (S)                | $SDR = 2S + 1$ | $SDR = 2 \times 5 + 1 = 11$ |

d = Outside pipe diameter in mm

e = Wall thickness in mm

S = Pipe series

Pipes classified as SDR 7.25 can be fused trouble-free with pipes of the classification SDR 7.4. The same applies to the fusing

compatibility of pipes and fittings SDR 17 and SDR 17.6. The deviations are within the admissible tolerances.

## Design factors and derived operating pressures

In various standards for PROGEF and PE we find design factors (formerly called safety factors) stated, these are for water. They are lower than the design factors recommended by GF Piping Systems for industrial applications. In order to protect human beings and the environment, those

safety factors can not be applied for industrial applications. We therefore recommend to use safety factors for PROGEF and PE 100 published in the following graphs, for the calculations of piping system pressures for industrial applications.

## Pressure/temperature diagram for PP

### PP-H

The following pressure/temperature diagrams for PP-H pipes and fittings are valid for a lifetime of 25 years.

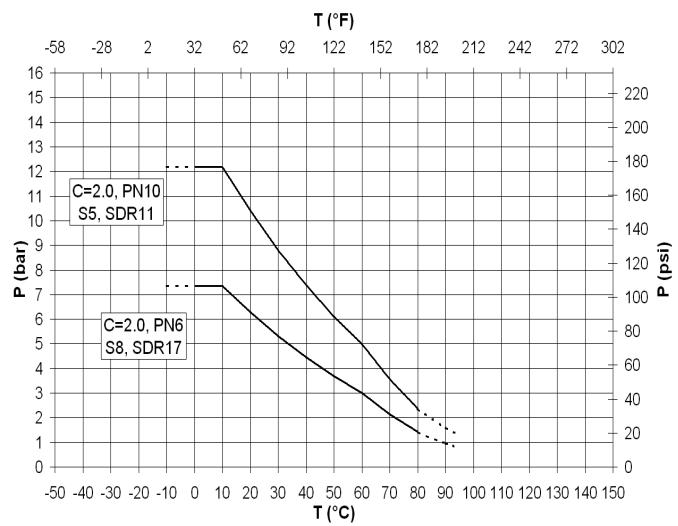

The design factor of 2.0 recommended by GF is incorporated.

They can be used for water or media resembling water, in other words, media which have no derating factor regarding the chemical resistance.

**Remark:** Please take into account the pressure/temperature diagrams for valves and special fittings. Because of the construction and/or sealing material used, differences are possible when compared with pipes and fittings. This information can be found in the planning fundamentals of the relevant types of valves, respectively special fittings.

According to the 10 °C line in the hydrostatic strength curve for PP-H, a permissible pressure of 12.2 bar / 7.4 bar in the temperature range of -10° to +10° C for the PN10 / PN6 system can be applied.

In case of applications with temperatures in the range of the dotted lines please contact your GF representative.

T Temperature in °C, °F

# Instructions for the installation of unions in PP, PE d 75, d 90 and d 110

The newest generation of plastic unions in the above materials and dimensions has been fitted with a state-of-the-art, plastics-oriented buttress thread. You therefore have a product in which the nominal pressure and the safety reserve have been dramatically increased. Also new are the butt fusion versions. In this connection, there are a few points which you must be aware of.

## Caution

- ① The threads of the union nut and bush have been reworked for PP, PVDF and PE! When using individual parts, please check prior to installation if the threads of the union bush and the union nut coincide.

or

## Tip

To make installation of the union easier, wet the union nut.

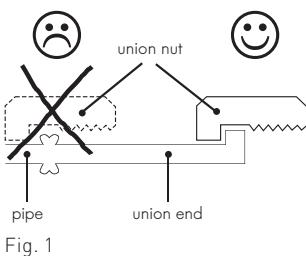

Fig. 1

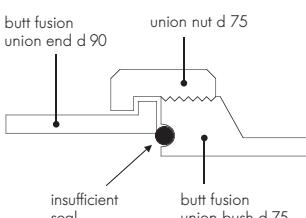

Fig. 2

## Caution

**Only use union bushes and union ends with the same nominal diameter!**

A butt fusion union bush d 75 may not be combined with a butt fusion union end d 90 to form a reducer because this can cause leakage, as illustrated to the left. (Fig. 2)

| 110         | specified for socket fusion d 110             |

## Tip

We recommend changing materials only for the union end for installation reasons.

# Instructions for the installation of unions in PP, PE d 75, d 90 and d 110

The newest generation of plastic unions in the above materials and dimensions has been fitted with a state-of-the-art, plastics-oriented buttress thread. You therefore have a product in which the nominal pressure and the safety reserve have been dramatically increased. Also new are the butt fusion versions. In this connection, there are a few points which you must be aware of.

## Caution

- ① The threads of the union nut and bush have been reworked for PP, PVDF and PE! When using individual parts, please check prior to installation if the threads of the union bush and the union nut coincide.

## Tip

To make installation of the union easier, wet the union nut.

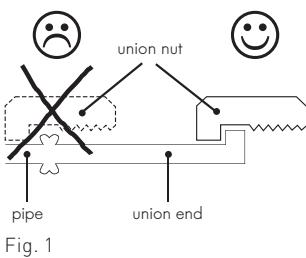

Fig. 1

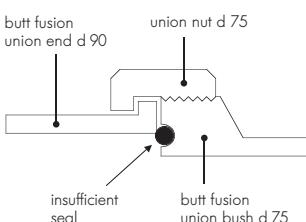

Fig. 2

## Caution

**Only use union bushes and union ends with the same nominal diameter!**

A butt fusion union bush d 75 may not be combined with a butt fusion union end d 90 to form a reducer because this can cause leakage, as illustrated to the left. (Fig. 2)

## General Information

### Material

The material PP-H conforms with the corresponding recommendations of the German Federal board of Health.

### Standards

All the main dimensions, such as nominal bore, z dimensions, socket depth and diameter, are in accordance with ISO Recommendations, ISO Draft Resolutions for millimetre pipes and DIN 3442.

### Jointing

#### Fusion jointing:

Pipes with outside diameter tolerances in accordance with DIN 8077 can be readily jointed with GF Piping Systems Valves.

#### Threaded joint:

BSP parallel female threads are in accordance with ISO 7/1 or DIN 2999. Threaded plastic Valves should be jointed to plastics pipe or to other plastics parts. Jointing to metal pipe or fittings is permissible only where there is little stress, and should be carried out with great care.

### Nominal Pressure

see column PN

### Marking

GF Piping Systems valves are marked as follows:

- +GF+
- pipe o.d.
- pipe nominal bore
- material
- pressure rating: PN ...

### Overall length

When used with flange adaptors or union ends from GF Piping Systems, the lengths of valves correspond to EN 558-1 (org. DIN 3202) or VSM standard 19431 and NF.E 29492.

### Dimensions

All dimensions are given in mm.

### Information Service

For detailed information see our Catalogue "Plastic Piping Systems".

### Quality control conforming to DIN 3442, Part 1

The function and tightness of every valve are factory-tested. Testing is carried out with air under water.

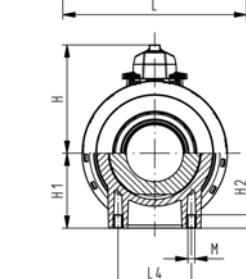

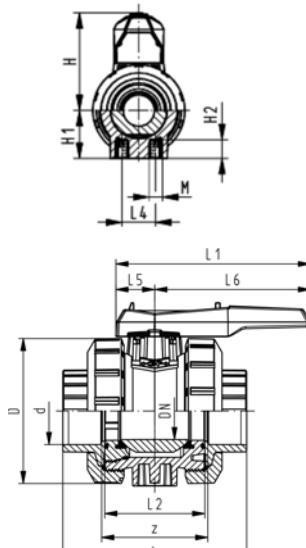

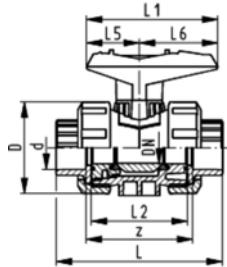

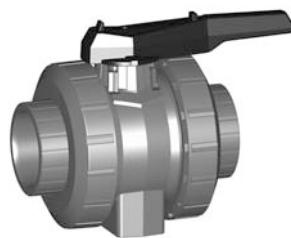

### Orders

Always quote the GF Piping Systems code number when placing orders.

## Pressure/temperature diagram for PP

### PROGEF® Natural

The following pressure/temperature diagram for PROGEF® Natural pipes and fittings is valid for a lifetime of 25 years.

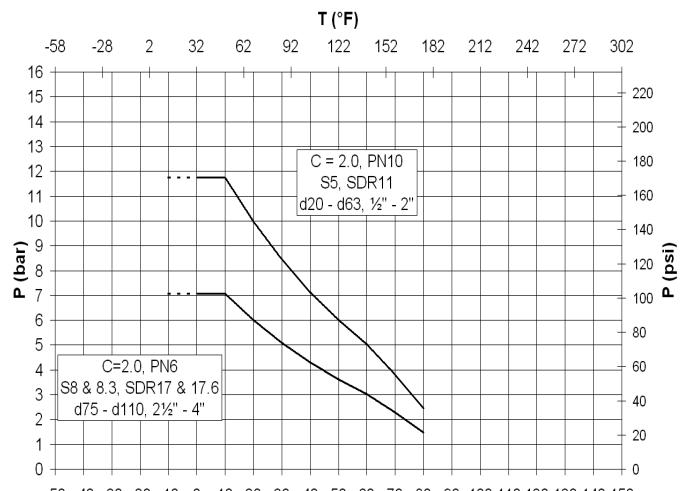

The design factor of 2.0 recommended by GF is incorporated.

It can be used for water or media resembling water, in other words, media which have no derating factor regarding the chemical resistance.

**Remark:** Please take into account the pressure/temperature diagrams for valves and special fittings. Because of the construction and/or sealing material used, differences are possible when compared with pipes and fittings. This information can be found in the planning fundamentals of the relevant types of valves, respectively special fittings.

**Remark:** Using PROGEF® Natural at higher temperatures can lead to a discoloration of the material.

In case of applications with temperatures in the range of the dotted lines please contact your GF representative.

## Pressure/temperature diagram for PE PE 100

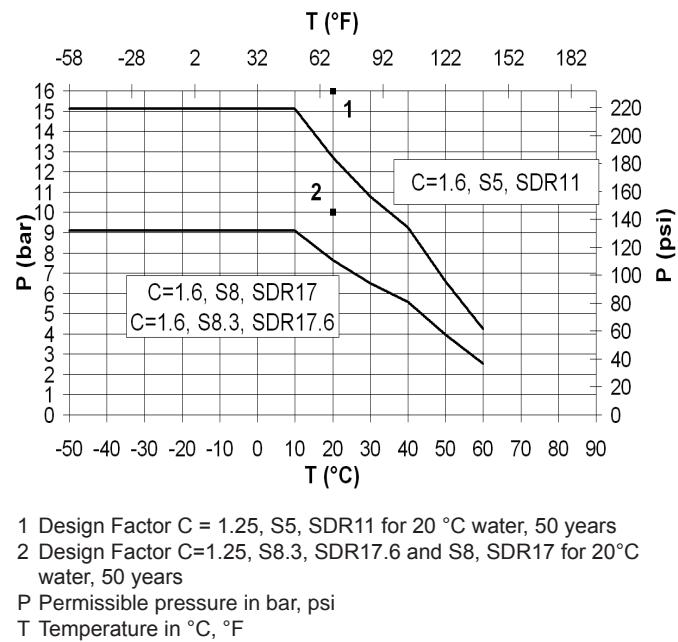

The following pressure/temperature diagram for PE100 pipes and fittings is valid for a lifetime of 25 years.

The design factor of 1.6 (respective 1.25) recommended by GF is incorporated.

It can be used for water or media resembling water, in other words, media which have no derating factor regarding the chemical resistance.

**Remark:** Please take into account the pressure/temperature diagrams for valves and special fittings. Because of the construction and/or sealing material used, differences are possible when compared with pipes and fittings. This information can be found in the planning fundamentals of the relevant types of valves, respectively special fittings.

In case of long-term applications at continuous pressure with temperatures above 40 °C, please contact your GF representative.

# Comparison of nominal pressure for SDR17 and SDR17.6

## Ascertaining the nominal pressure (PN)

According to the standard, the nominal pressure is a numeric measure of the size of a pipeline part, which refers to the mechanical properties of that pipeline part. Besides the geometric sizes such as SDR, the creep strength/dimensioning tension and the minimum design factor are also taken into consideration.

For plastic piping systems intended to carry water, the nominal pressure value indicates the maximum permitted operating pressure in bar, at a temperature of 20°C, and 50 years in water, referenced to the minimum value of the total (calculation) coefficients. It is calculated using the following equation:

$$[PN] = 10 \cdot \sigma_S / [S] = 20 \cdot \sigma_S / (SDR - 1) \quad (\sigma_S \text{ in MPa}, PN \text{ in bar})$$

## Minimum required strength (MRS):

The value of  $\sigma_{LCL}$  at 20°C and 50 years in water, rounded down to the next value in the R10 standard series of numbers.

$\sigma_{LCL}$  is understood to mean the equivalent stress ascertained for a given period and a given temperature from the time-dependent creep diagram. LCL stands for Lower Confidence Limit. The R10 standard series of numbers is a Renard standard series of numbers as per ISO 3 and ISO 497.

## Design stress ( $\sigma_S$ ):

The permitted stress for a particular application or operating conditions stated in megapascal. It is derived by dividing the MRS by coefficient C and is calculated as shown in the equation below:

$$\sigma_S = MRS / C$$

The calculated value is rounded down to the next value in the R10 standard series of numbers.

## Total operating (calculation) coefficient (C):

A total coefficient having a value greater than one, which takes into account both the operating conditions and also the characteristics of the pipeline component that have not yet been entered into the lower confidence limit  $\sigma_{LCL}$ .

If we use the above definition to calculate the relevant nominal pressure for both SDR classes, the result for a PE 100 pipe is as follows:

| SDR17                      | SDR17.6                    |
|----------------------------|----------------------------|
| MRS = 10 MPa               | MRS = 10 MPa               |
| C = 1.25 (minimum factor)  | C = 1.25 (minimum factor)  |
| $\sigma = 8.0 \text{ MPa}$ | $\sigma = 8.0 \text{ MPa}$ |
| PN = 10 bar                | PN = 9.6 bar               |

The above definitions thus produce a difference of 0.4 bar in PN, but in actual practice this does not matter, as shown below:

1.) Industrial pipelines are normally designed for a service life of 25 years. If from the time-dependent creep diagrams we ascertain for ELTEX TUB 121 or CRP 100 an equivalent stress of  $\sigma_{LCL}$  for the operating point of 25 years and 20°C, we obtain a tension of 10.6 MPa (minimum value of both PE100 materials as per manufacturer's data).

2.) If we use this tension to ascertain the dimensioning tension  $\sigma_S$ , and do not round it down, we obtain the value of 8.48 MPa.

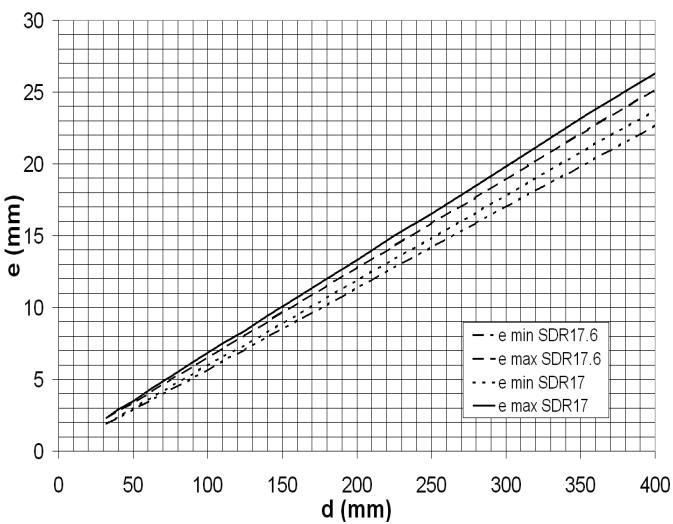

3.) Thus the actual nominal pressure in practice is:

for SDR 17 => PN = 10.6 bar and for  
SDR 17.6 => PN = 10.2 bar.

**To summarise: Both SDR classes comply with requirements for industrial applications mentioning a PN10 system.**

## Comparison of geometric dimensions

The two SDR classes differ only slightly in wall thickness, as can be seen from the diagram below. This shows that there is an area where the wall thickness complies with both requirements of both SDR classes.

d Outside pipe diameter

e Wall thickness

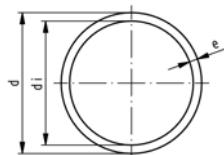

For butt fusion the wall thickness gap may not exceed 10 %. Looking at the differences of the wall thicknesses of SDR17 and SDR17.6 the resulting gap is much lower, that means butt fusion of both SDR's is no problem.

# Instructions for the installation of unions in PP, PE d 75, d 90 and d 110

The newest generation of plastic unions in the above materials and dimensions has been fitted with a state-of-the-art, plastics-oriented buttress thread. You therefore have a product in which the nominal pressure and the safety reserve have been dramatically increased. Also new are the butt fusion versions. In this connection, there are a few points which you must be aware of.

## Caution

- ① The threads of the union nut and bush have been reworked for PP, PVDF and PE! When using individual parts, please check prior to installation if the threads of the union bush and the union nut coincide.

## Tip

To make installation of the union easier, wet the union nut.

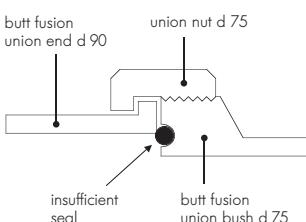

Fig. 2

## Caution

**Only use union bushes and union ends with the same nominal diameter!**

A butt fusion union bush d 75 may not be combined with a butt fusion union end d 90 to form a reducer because this can cause leakage, as illustrated to the left. (Fig. 2)

## Markings on the union nuts

SF/MS = socket fusion, BF/ST = butt fusion

|-------------|-----------------------------------------------|
| SF/MS 75    | specified for socket fusion d 75              |
| BF/ST 75-90 | specified for butt fusion d 75-75 and d 90-90 |
| SF/MS 90    | specified socket fusion d 90                  |
| BF/ST 110   | specified butt fusion d 110                   |
| 110         | specified for socket fusion d 110             |

## Tip

We recommend changing materials only for the union end for installation reasons.

- 4.2 All technical documents shall remain the exclusive property of Georg Fischer and may only be used for the agreed purposes or as Georg Fischer may consent.

## 5 Confidentiality, Protection of Personal Data

- 5.1 Each party shall keep in strict confidence all commercial or technical information relating to the business of the other party, of which it has gained knowledge in the course of its dealing with the other party. Such information shall neither be disclosed to third parties nor used for other purposes than those for which the information has been supplied.
- 5.2 In the context of the contractual relation with the Purchaser personal data may be processed. The Purchaser agrees to the disclosure of said data to third parties such as foreign subcontractors and suppliers etc .

- 9.1 The Products shall remain the property of Georg Fischer until the Purchaser shall have settled all claims, present and future, which Georg Fischer may have against him.
- 9.2 Should the Purchaser resell Products to which title is reserved, in the ordinary course of business, he shall hereby be deemed to have tacitly assigned to Georg Fischer the proceeds deriving from their sale together with all collateral rights, securities and reservations of title until all claims held by Georg Fischer shall have been settled. Until revoked by Georg Fischer, this assignment shall not preclude Purchaser's right to collect the assigned receivables.
